

## Technology & the Future

### **Title:**

*An AI host, a global production system—and a format that connects proximity and technology*

### **Subheading:**

ONE Pulse ODC is built around an animated AI avatar who interacts with personalities and the community, structures the day, and takes over moderation at night.

### **Text:**

The technological core of ONE Pulse ODC lies in the combination of dialogue-driven AI and a weekly live production that unfolds in changing locations. A multi-layered system analyzes audio, movement patterns, and situational signals to make emotional intensity visible through aggregated audience responses—referred to as the **Lux Value**. The technological infrastructure was developed in Germany and is scaled in the United States for streaming and spatial platforms.

At the center is **Radius**, an animated retro television avatar who serves as the host throughout the week. He speaks with the featured personality, poses questions, explains cultural contexts, and reflects on the emotions of each day. During the nightly sessions, Radius moderates independently and responds in parallel to community questions—creating a unique blend of technological demonstration and narrative continuity.

ONE Pulse ODC demonstrates that AI does not create distance, but proximity—as a figure, a voice, and a connective element within a global live format.
